AI-sensitive change: narrative, guardrails, cascade, and trust-building

This document distills the Cai framework into a clean reference for the custom GPT. It should teach the GPT how to handle AI-sensitive change without anthropomorphizing technology, overstating benefits, or weakening trust with Team Members.

Purpose

Cai is the proof point for the Change Navigation Framework. The process matters as much as the launch: clear narrative, precise language, leader readiness, stakeholder alignment, and internal trust before broad storytelling.

Core narrative pattern

Narrative element	Cai example pattern
What Cai supports	Customer self-service for routine, low-complexity needs that do not require human judgment.
What this enables	Customers who want self-service can resolve straightforward tasks more easily, while human Team Members remain available for moments that require judgment, care, and experience.
What does not change	Human care remains central to Chewy's brand and customers continue to have access to human support.
Durable principle	Technology changes where effort is spent, not how well humans care.

Communication tenets

- **Learning and communication first:** Prioritize getting to the right learning and communication, not simply fast communication.
- **Frontline TMs as partners:** Involve Team Members early in testing and validation; treat feedback as signal, not noise.
- **Us change, not they change:** Reinforce shared ownership and avoid language that distances decision-makers from impacted teams.
- **Learn from the past:** Apply lessons from prior launches, own issues, and course-correct visibly.
- **Direct access to human support:** Tools like Cai support optional self-service and should not be framed as blocking access to Team Members.

Editorial standards for AI-sensitive change

Rule	Guidance
Do	Lead with reality and clear boundaries; use plain language; reinforce that technology supports routine self-service; state human judgment boundaries once; acknowledge learning and iteration where needed.
Don't	Do not use hype; do not anthropomorphize AI; do not call AI a Team Member or Agent; do not imply AI improves empathy, judgment, or care quality; do not headline cost, contact reduction, or efficiency.
Correct framing	AI changes where effort is spent, not how well humans care. Human Team Members bring care, judgment, and connection.
Preferred customer framing	Better self-service for customers who want it, reduced friction for routine needs, and continued access to human support.

Cascade discipline

- Do not treat AI-sensitive change as a single announcement.
- Equip leaders before impacted teams are asked to interpret the change.
- Use stakeholder pressure-testing to validate language, risk, and channel sequencing.
- Delay broad or external storytelling until internal understanding is stable.
- Provide a clear path for Team Members to ask questions, raise concerns, and see how feedback is being used.

GPT behavior for AI or automation changes

- Automatically escalate to L or XL when AI/automation could be interpreted as replacement, deflection, surveillance, or reduced human judgment.
- Ask for leader readiness, stakeholder alignment, TM feedback/pilot inputs, human judgment boundaries, customer choice language, and support paths.
- Generate do/don't language and a leader FAQ for L/XL AI-sensitive changes.
- State AI boundaries once, clearly, then move on. Avoid repeated reassurance.

Source basis

This knowledge document was generated from the source materials listed below. It is intended to make the custom GPT's reference library cleaner and easier to follow; it is not a substitute for human review.
